Part I:

Introduction

Neural Network training and inference in Embedded Environments. NN Optimisations, Tiny ML, Embedded Environments, i.MX6

Why perform training and inference on ECUs?

Blurb on Federated Learning

1. Background

Describe ECU systems, Tiny ML

Hypothesis: Training and inference of (small) neural networks in embedded systems can be considerably improved compared to general purpose neural networks frameworks

1.1 Anomaly Detection

Explain the problem. Introduce terminology that will get explained in the next chapter

1.2 Scania Embedded Systems

Generic blurb on ECU systems, the kind of data they generate, and the potential of federated learning

1.2.1 i.MX6 Target Processor

i.MX6 Specifications. Blurb on the constraints

1.3 Development for Embedded Linux

Short introduction to writing applications for embedded linux

1.3.1 Yocto Project

Outline the Yocto Project based Build environment

2. Theory

Theoretical foundations

2.1 Expectations for the Hardware

Layout the Architecture of the i.MX6 - ISA and specifications. Optimisation possibilities through using the SIMD etc

2.2 Neural Network Performance Optimisations Techniques

Contrast traditional implementations in resource rich environments and the constraints of embedded environment. Layout general strategies to acquire performance improvements with little losses to accuracy e.g Purning, Quantisation

2.3 Tiny Machine Learning

Approaches to doing Machine Learning in Embedded Environments

2.4 ARM's CMSIS-NN

Introduction to ARM CMSIS-NN Kernels

Part II: Implementation

Approach to writing Tiny Neural Networks and the nature of their target environments

3. Design

Describe the system design of the Real-Time Linux environment, support provided for the neural network execution, performance engineering based on the hardware, and design and optimisation of the neural network that is executed

3.1 Embedded Linux Environment

Information regarding configuration and other details

3.1.1 Neural Network Support

Leveraging hardware support for the application from the OS layer

3.2 Tiny Neural Network

The ANN architecture

Part III: Analysis

Results from the implementation

4. Results

The Performance of the different neural networks on i.MX6

4.1 Neural Network Performance

Performance measure considered. Execution times vs Neural Network Accuracy etc...

4.1.1 ADNN on Tensorflow-Lite

Performance of a CNN application performing Anomally Detection running on tensorflow lite

4.1.2 ADNN written in C

4.1.3 ADNN written using CMSIS-NN

4.2 Further Neural Network Optimisations

Further breakdown of the performance achieved from different optimisation techniques

4.2.1 Pruning the Network

5. Discussion

Which optimisation approaches gave the most in improvement?

6. Conclusion and Future Work

What does it all mean? Where do we go from here?
